

**AMENDMENTS TO THE CLAIMS**

This listing of claims will replace all prior versions, and listings, of claims in the application.

**Listing of Claims:**

1. (Currently amended) An automation security system, comprising:  
an asset component that defines ~~one or more factory assets~~ an industrial automation device;  
an access component that defines ~~one or more~~ a security attribute[[s]] associated with the ~~factory assets~~ industrial automation device; and  
a security component that regulates access to the ~~factory assets~~ industrial automation device based upon the ~~one or more~~ security attribute[[s]].
2. (Currently Amended) The system of claim 1, the ~~one or more or more~~ security attribute[[s]] including at least one of a role attribute, a time attribute, a location attribute, and an access type attribute.
3. (Original) The system of claim 1, the security component is based on at least one of a formal threat analysis, a vulnerability analysis, a factory topology mapping and an attack tree analysis.
4. (Original) The system of claim 3, the security component is based on at least one of automation and process control security, cryptography, and Authentication/Authorization/Accounting (AAA).
5. (Original) The system of claim 1, the asset component describes at least one of factory components and groupings, the factory components are at least one of sensors, actuators, controllers, I/O modules, communications modules, and human-machine interface (HMI) devices.

6. (Original) The system of claim 5, the groupings include factory components that are grouped into at least one of machines, machines grouped into lines, and lines grouped into facilities.
7. (Original) The system of claim 5, the groupings have associated severity attributes such as at least one of risk and security incident cost.
8. (Original) The system of claim 7, further comprising an ISA S95 Model for Enterprise to Control System Integration to integrate security aspects across or within respective groupings.
9. (Currently Amended) The system of claim 1, further comprising a set of generic IT components and specifies parameters to assemble and configure the IT components to achieve flexible access to the ~~one or more factory assets~~ industrial automation device.
10. (Original) The system of claim 9, the IT components include at least one of switches with virtual local area network (VLAN) capability, routers with access list capability, firewalls, virtual private network (VPN) termination devices, intrusion detection systems, AAA servers, configuration tools, and monitoring tools.
11. (Original) The system of claim 1, further comprising security parameters and policies that are developed for physical and electronic security for various component types.
12. (Original) The system of claim 11, the security parameters and policies further comprising at least one of security protection levels, identification entry capabilities, integrity algorithms, and privacy algorithms.
13. (Original) The system of claim 1, the security component includes at least one of authentication software, virus detection, intrusion detection, authorization software, attack detection, protocol checker, and encryption software.

14. (Original) The system of claim 13, the security component at least one of acts as an intermediary between an access system and one or more automation components, and facilitates communications between the access system and the one or more automation components.
15. (Currently Amended) The system of claim 2, the security attributes are specified as part of a network request to gain access to the ~~one or more factory assets~~ at least one industrial automation device, the security attributes included in at least one of a group, set, subset, and class.
16. (Original) The system of claim 15, the security component employs at least one authentication procedure and an authorization procedure to process the network request.
17. (Original) The system of claim 16, further comprising one or more security protocols including at least one of Internet Protocol Security (IPSec), Kerberos, Diffie-Hellman exchange, Internet Key Exchange (IKE), digital certificate, pre-shared key, and encrypted password, to process the network request.
18. (Original) The system of claim 15, further comprising at least one of an access key and a security switch to control network access to a device or network.
19. (Original) The system of claim 18, the access key further comprises at least one of time, location, batch, process, program, calendar, GPS (Global Positioning Information) to specify local and wireless network locations, to control access to the device or network.
20. (Currently amended) An automation security system, comprising:  
a server[[s]] that manages a network interface between networked ~~factory assets~~ industrial automation devices and other devices attempting access to the networked ~~factory assets~~ industrial automation devices; and  
a security management module associated with the network interface ~~for enforcing that enforces~~ enforces an enterprise wide policy and ~~to that manages~~ security threats directed to the networked ~~factory assets~~ industrial automation devices.

21. (Original) The system of claim 20, the security management module at least one of schedules audits, establishes a security policy, applies the policy from a single or distributed console, and generates reports that identify potential weaknesses in security.
22. (Original) The system of claim 20, the security management module provides an interface to at least one of add, delete and modify security rights of an individual, a group, or a device and distribute security information to various controllers and control devices.
23. (Currently Amended) The system of claim 20, further comprising at least one of:  
an authentication with the ~~one or more~~ server[[s]] to establish a secure link;  
a secure link to authenticate and authorize access to a requestor of the networked ~~factory~~ assets industrial automation device; and  
establishment of a secure session with the requestor if access is authorized.
24. (Currently amended) An automation security methodology, comprising:  
electronically analyzing ~~one or more automation assets~~ an industrial automation device;  
programmatically modeling the ~~automation assets~~ industrial automation device in accordance with network security considerations; and  
automatically developing a security framework for an automation system based in part on the modeling of the ~~automation assets~~ industrial automation device and a network access type.
25. (Currently Amended) The method of claim 24, further comprising analyzing one or more security attributes to determine whether access should be granted to the ~~one or more automation assets~~ industrial automation device.
26. (Original) The method of claim 25, the one or more security attributes further comprise at least one of a role, an asset type, a location, a time, and an access type.

27. (Currently Amended) The method of claim 24, further comprising at least one of:  
determining whether to grant access to the ~~one or more automation assets~~ industrial automation device;  
granting access from the ~~one or more automation assets~~ industrial automation device; and  
granting access from a network device associated with the ~~one or more automation assets~~ industrial automation device.
28. (Currently amended) An automated security system for an industrial control environment, comprising:  
means for defining one or more security attributes associated with at least one network request;  
means for processing the one or more security attributes;  
means for automatically determining which network devices require security resources;  
and  
means for controlling access to at least one of a network device and an industrial automation component based in part on the one or more security attributes.
29. (Currently amended) A security schema for a factory automation system, comprising:  
a first data field that describes ~~factory assets~~ industrial automation devices;  
a second data field that describes security parameters for the ~~factory assets~~ industrial automation devices; and  
a schema that associates the first and second data fields, the schema employed to limit access to the ~~factory assets~~ industrial automation devices based upon the security parameters.
30. (Original) The system of claim 29, the schema including at least one of an access role, an asset type, an access type, time information, address information, and location information.
31. (Original) The system of claim 29, further comprising a response schema to provide status to a requesting network device.

32. (Original) The system of claim 31, the response schema including at least one of a status field, a time field, an access type field, an access location field, and a key field.
33. (Original) The system of claim 31, the response schema including an attachment field to indicate other security data follows the response schema.
